- (2) Have external overcurrent protection: and
- (3) Meet Sections 35.84.2 and 35.84.4 of the American Bureau of Shipping (ABS), "Rules for Building and Classing Steel Vessels," or other standard specified by the Commandant.

§183.370 General grounding requirements.

- (a) A vessel's hull must not carry current as a conductor except for the following systems:
- (1) Impressed current cathodic protection systems; or
- (2) Battery systems for engine starting.
- (b) Receptacle outlets and attachment plugs for portable lamps, tools, and similar apparatus operating at 100 volts or more, must have a grounding pole and a grounding conductor in the portable cord.
- (c) Each nonmetallic mast and top mast must have a lightning ground conductor.

§183.372 Equipment and conductor grounding.

- (a) All metallic enclosures and frames of electrical equipment must be permanently grounded to the hull on a metallic vessel. On a nonmetallic vessel, the enclosures and frames of electrical equipment must be bonded together to a common ground by a normally non-current carrying conductor. Metallic cases of instruments and secondary windings of instrument transformers must be grounded.
- (b) On a nonmetallic vessel, where a ground plate is provided for radio equipment, it must be connected to the common ground.
- (c) Equipment grounding conductors must be sized in accordance with Section 250-95 of the NEC (NFPA 70), or other standard specified by the Commandant.
- (d) Each insulated grounding conductor of a cable must be identified by one of the following means:
 - (1) A green braid or green insulation;
- (2) Stripping the insulation from the entire exposed length of the grounding conductor; or
- (3) Marking the exposed insulation of the grounding conductor with green tape or green adhesive labels.

(e) Cable armor must not be used to ground electrical equipment or systems

$\$\,183.376$ Grounded distribution systems (neutral grounded).

- (a) If a grounded distribution system is provided, there must be only one connection to ground, regardless of the number of power sources. This ground connection must be at the switchboard or at the common ground plate, which must be accessible.
- (b) Each propulsion, power, lighting, or distribution system having a neutral bus or conductor must have the neutral grounded.
- (c) The neutral of each grounded generation and distribution system must be grounded at the generator switch-board and have the ground connection accessible for checking insulation resistance of the generator to ground before the generator is connected to the bus, except the neutral of an emergency power generation system must be grounded with:
- (i) No direct ground connection at the emergency switchboard;
- (2) The neutral bus permanently connected to the neutral bus on the main switchboard; and
- (3) No switch, circuit breaker, or fuse in the neutral conductor of the bus-tie feeder connecting the emergency switchboard to the main switchboard.
- (d) On a metallic vessel, a grounded alternating current system must be grounded to the hull. On a nonmetallic vessel, the neutral must be connected to the common ground, except that aluminum grounding conductors must not be used.

§ 183.378 Ungrounded systems.

Each ungrounded system must be provided with a suitably sensitive ground detection system located at the respective switchboard that provides continuous indication of circuit status to ground with a provision to momentarily remove the indicating device from the reference ground.

[CGD 85-080, 62 FR 51358, Sept. 30, 1997]

§ 183.380 Overcurrent protection.

(a) Overcurrent protection must be provided for each ungrounded conductor for the purpose of opening the
